Re: Well No. 15 Pump Test

Dear Gary:

Submitted here with is our report on the results of the 14-day pump test on Well No. 15. We appreciate the cooperation of District Staff in providing measurements and graphical plots for the pump test results.

Sincerely Yours,

  
Kenneth D. Schmidt

KDS/pe

RESULTS OF 14-DAY PUMP TEST  
ON MAMMOTH CWD WELL NO. 15

INTRODUCTION

The purpose of this aquifer test was to evaluate whether there is any interaction between District well pumping and streamflow in Mammoth Creek. District Well No. 15 was selected as the well to be pumped during the test. Surface water was used during the test period to meet system demands during non-pumping periods and to supplement groundwater to meet system demands during the period when Well No. 15 was pumping.

The test included an antecedent phase from October 17 through October 23, 2007 when District wells were not pumped, except for Well No. 16 and 17. The pumping phase of the test was then conducted where Well No. 15 was pumped from 12:31pm on October 24 until 8:31am on November 7, 2007. Well No. 15 was pumped continuously during this period, except for periods that were about six minutes long every eight hours to allow for treatment plant filter cleaning. During the pumping phase, Well No. 17 had to be pumped for three days and Well No. 16 pumped for two days to provide backup water supply. A recovery phase then occurred, where there was no groundwater pumping for seven days from November 8 through November 14.

WELLS USED FOR TEST

Wells in which water levels were measured during the test included District Production Wells No. 1, 15 and 17, Monitor Wells

No. 4, 5A, 5M, 22, 23, 28, and 30, and a shallow private monitor well near Mammoth Creek identified as B-3. Table 1 provides construction data for these wells, where available. Data loggers were used to monitor water levels in Production Wells No. 1 and 15 and in Monitor Wells No. 23 and 28. Streamflow rates in Mammoth Creek were measured at the District's Old Mammoth Road gaging station utilizing a data logger. Figure 1 shows the locations of the wells and streamgage.

#### ANTECEDENT MEASUREMENTS

Antecedent water-level measurements for the wells are provided in Appendix A.

##### Pumped Well

The water level in Well No. 15 was rising at an average rate of about 0.30 foot per day before pumping began.

##### Observation Wells

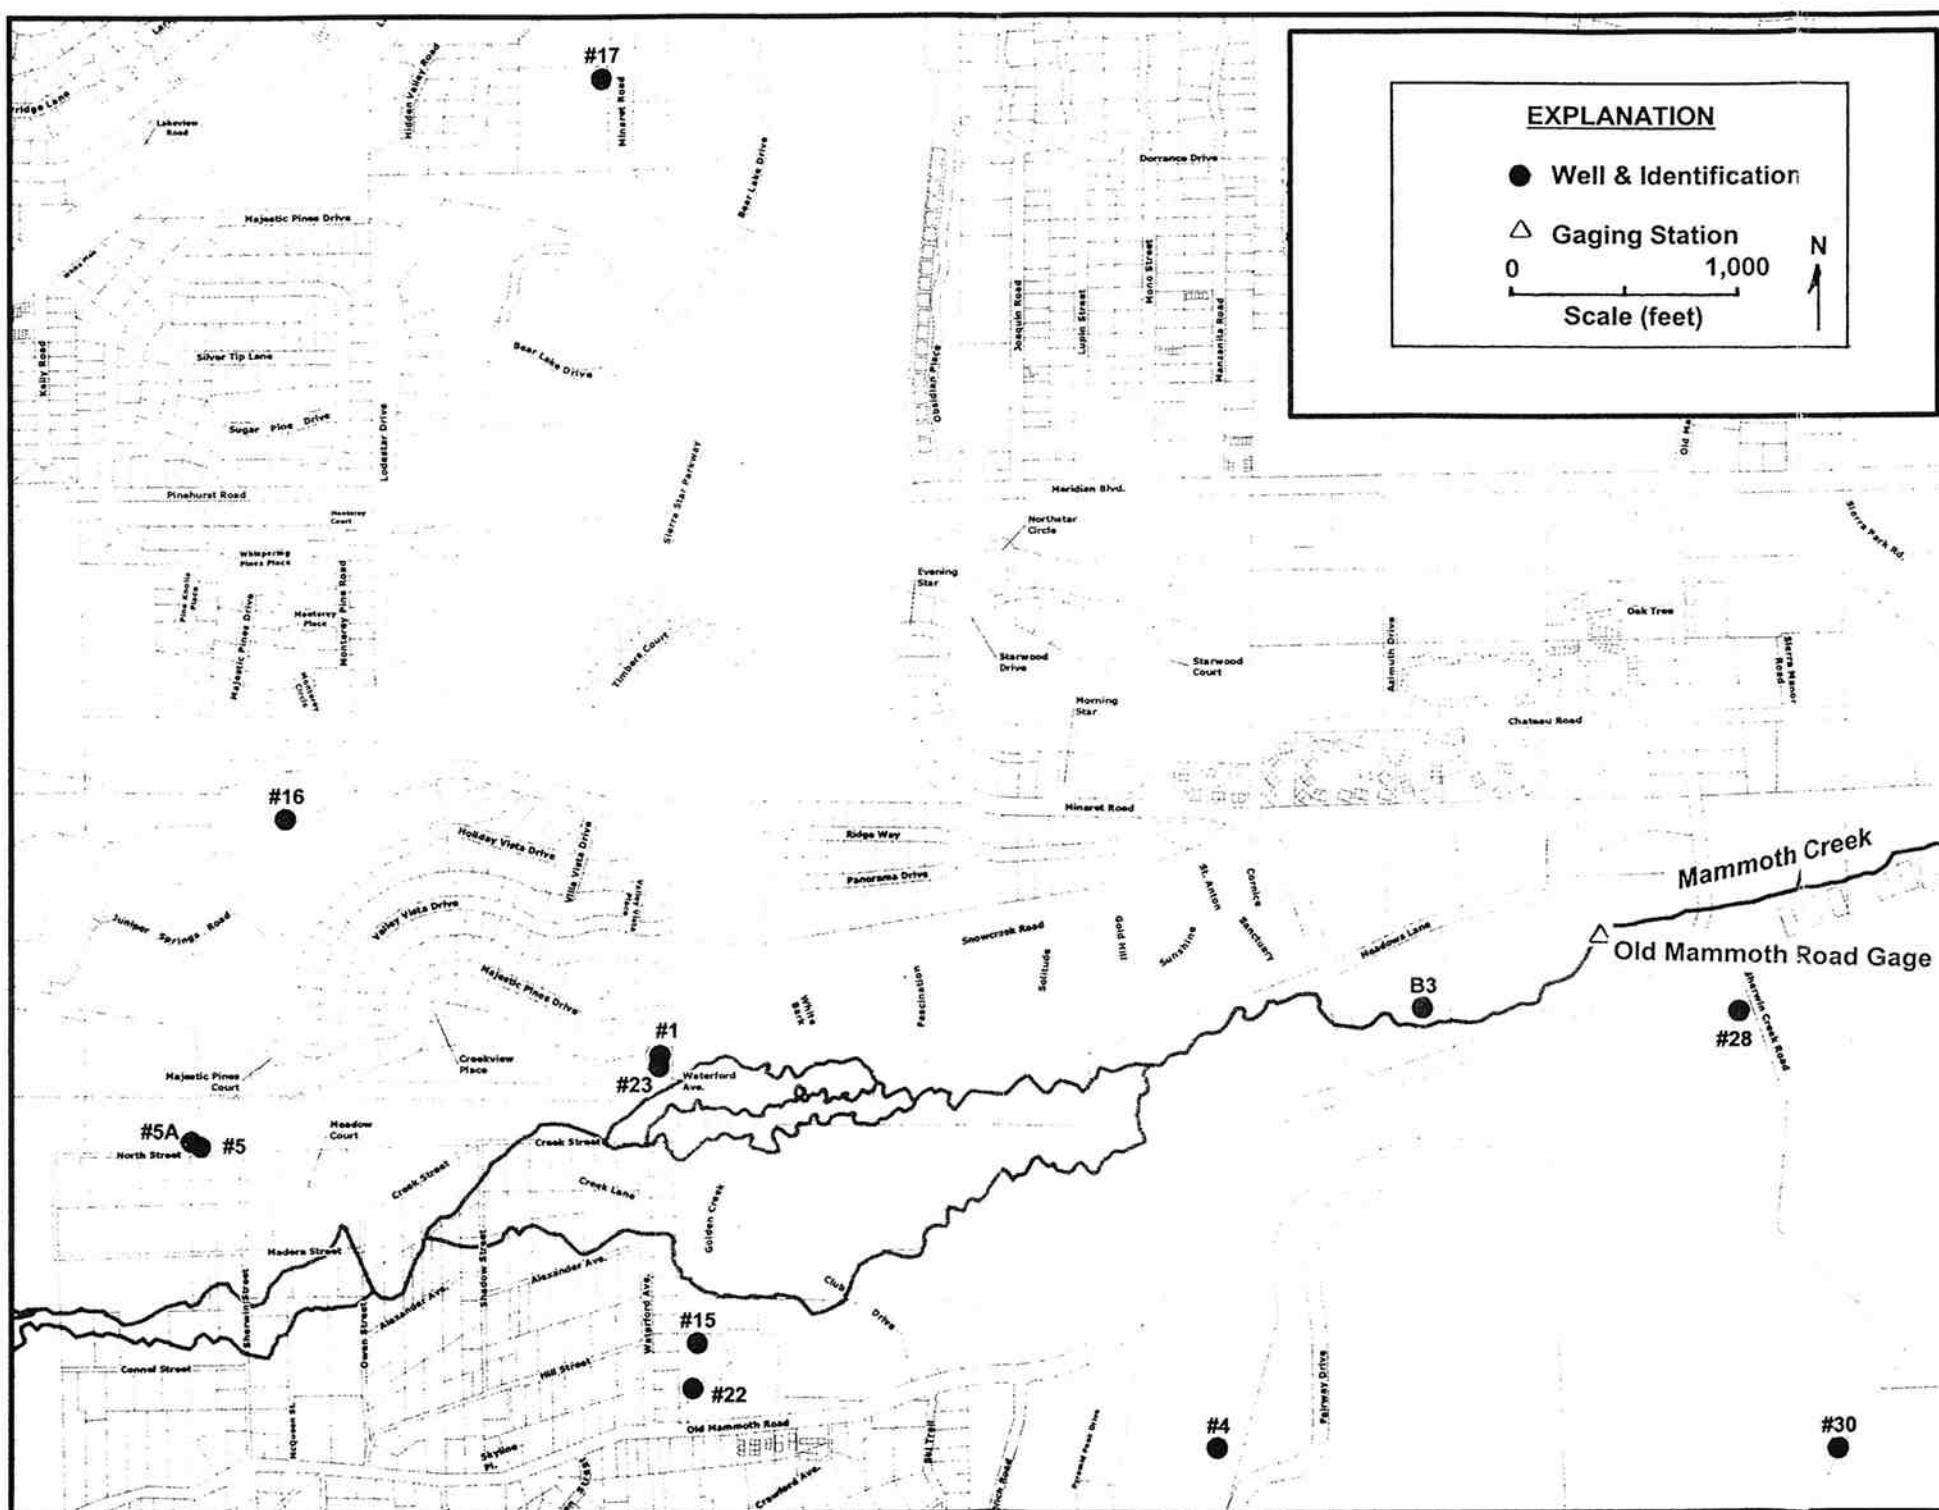

###### Deep

The water level in Well No. 1 was rising an average of about 0.27 foot per day prior to pumping of Well No. 15. The water level in Well No. 17, in contrast, was 0.45 foot deeper at the end of the antecedent period prior to pumping of Well No. 15, due to intermittent pumping of Well No. 17 that was necessary on October 21 and 22. The water levels in Wells No. 5A and 28 were slightly falling

B-3	-	-	-	-	-	-

Well No. 15 was pumped for the test, and the other wells were used as observation wells.  
 No information on construction is available for B-3.

## **FIGURE 1-LOCATION OF WELLS USED FOR TEST AND STREAMGAGE**

prior to pumping of Well No. 15. The water level in Well No. 30 was relatively stable prior to pumping Well No. 15.

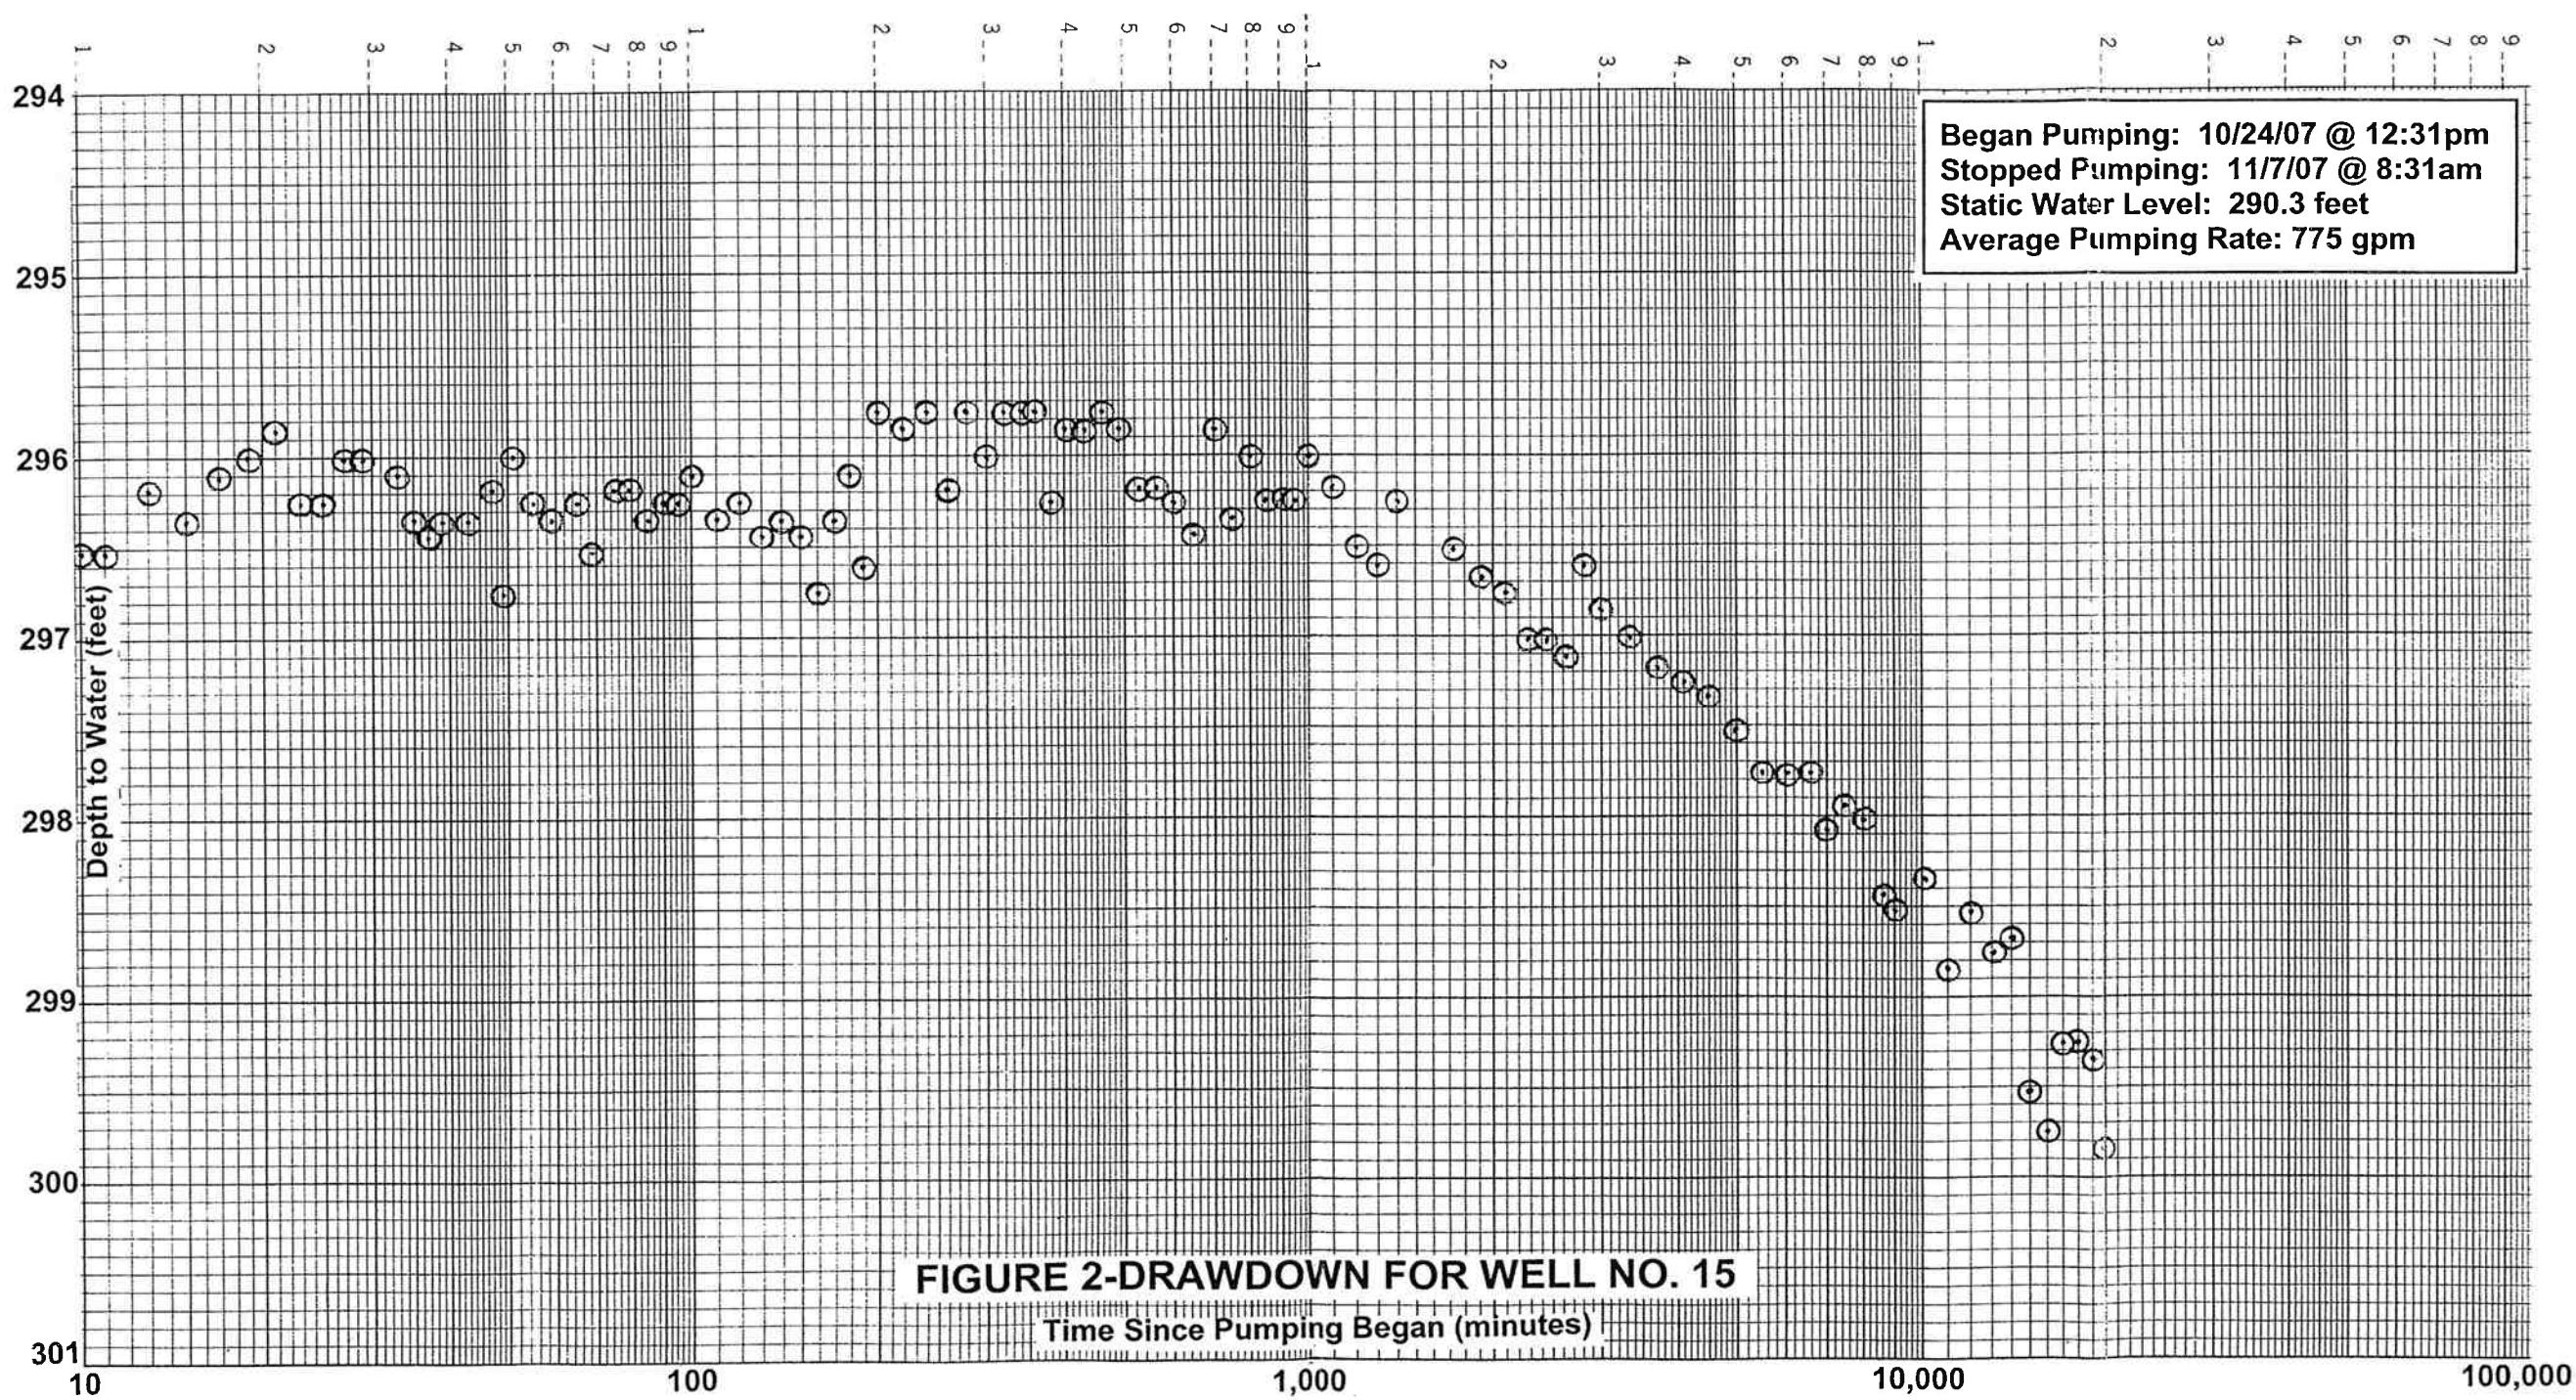

#### Shallow

The water levels in Wells 5-M, B-3, and M-23 were relatively stable prior to the commencement of pumping of Well No. 15. The water level in Well 4M was falling at an average rate of about 0.05 foot per day prior to pumping. The water level in M-22 was falling at an average rate of 0.15 foot per day prior to the commencement of pumping of Well No. 15. Water-level hydrographs for the observation wells are provided in the next section of this report.

#### DRAWDOWN MEASUREMENTS

##### Pumped Well

Pumpage and drawdown measurements for the test are provided in Appendix B. A total of 15,437,500 gallons of water was pumped from Well No. 15 during the 14-day test, and the average pumping rate was 776 gpm. Figure 2 shows drawdown measurements for the pumped well. The static water level in Well No. 15 prior to pumping was 290.3 feet deep and the pumping level was 296.1 feet deep at the end of pumping. The drawdown was 5.8 feet and the specific capacity was 134 gpm per foot. Drawdown measurements for Well No. 15 during the 14-day test indicate an aquifer transmissivity of 30,000 gpd per foot. A 46-hour pump test was conducted on Well No. 15 during July 1-3, 1992. A transmissivity of 34,000 gpd per foot was determined for that test.

### Observation Wells

#### Deep

Well No. 1 had a relatively constant level during pumping of Well No. 15 (Figure 3). When considering the antecedent and post pumping water-level rises in Well No. 1 (0.25 foot per day and 0.19 foot per day), the estimated drawdown in Well No. 1 during pumping of Well No. 15 was 3.4 feet. The water level in Well 5A did not significantly change during pumping of Well No. 15, and this was consistent with the antecedent trend (Figure 4). The water level in Well No. 17 rose 0.51 foot, or an average of 0.04 foot per day, during pumping of Well No. 15 (Figure 5), compared to a decline prior to pumping. The water level in Well No. 30 rose 0.58 foot, or an average of 0.05 foot per day, during pumping of Well No. 15, compared to a relatively stable water level during the antecedent period.

#### Shallow

The water level in Well No. 4M (Figure 7) fell 0.35 foot during pumping of Well No. 15, or an average of 0.03 foot per day, which was less than the antecedent water-level decline (0.05 feet per day). The water levels in Well 5M rose 0.15 foot during pumping of Well No. 15, compared to near stable levels for the antecedent period (Figure 8). The water level in Well No. 22 fell 1.86 feet, or an average of 0.14 foot per day, during pumping of Well No. 15 (Figure 9). The antecedent water-level decline in Well No.

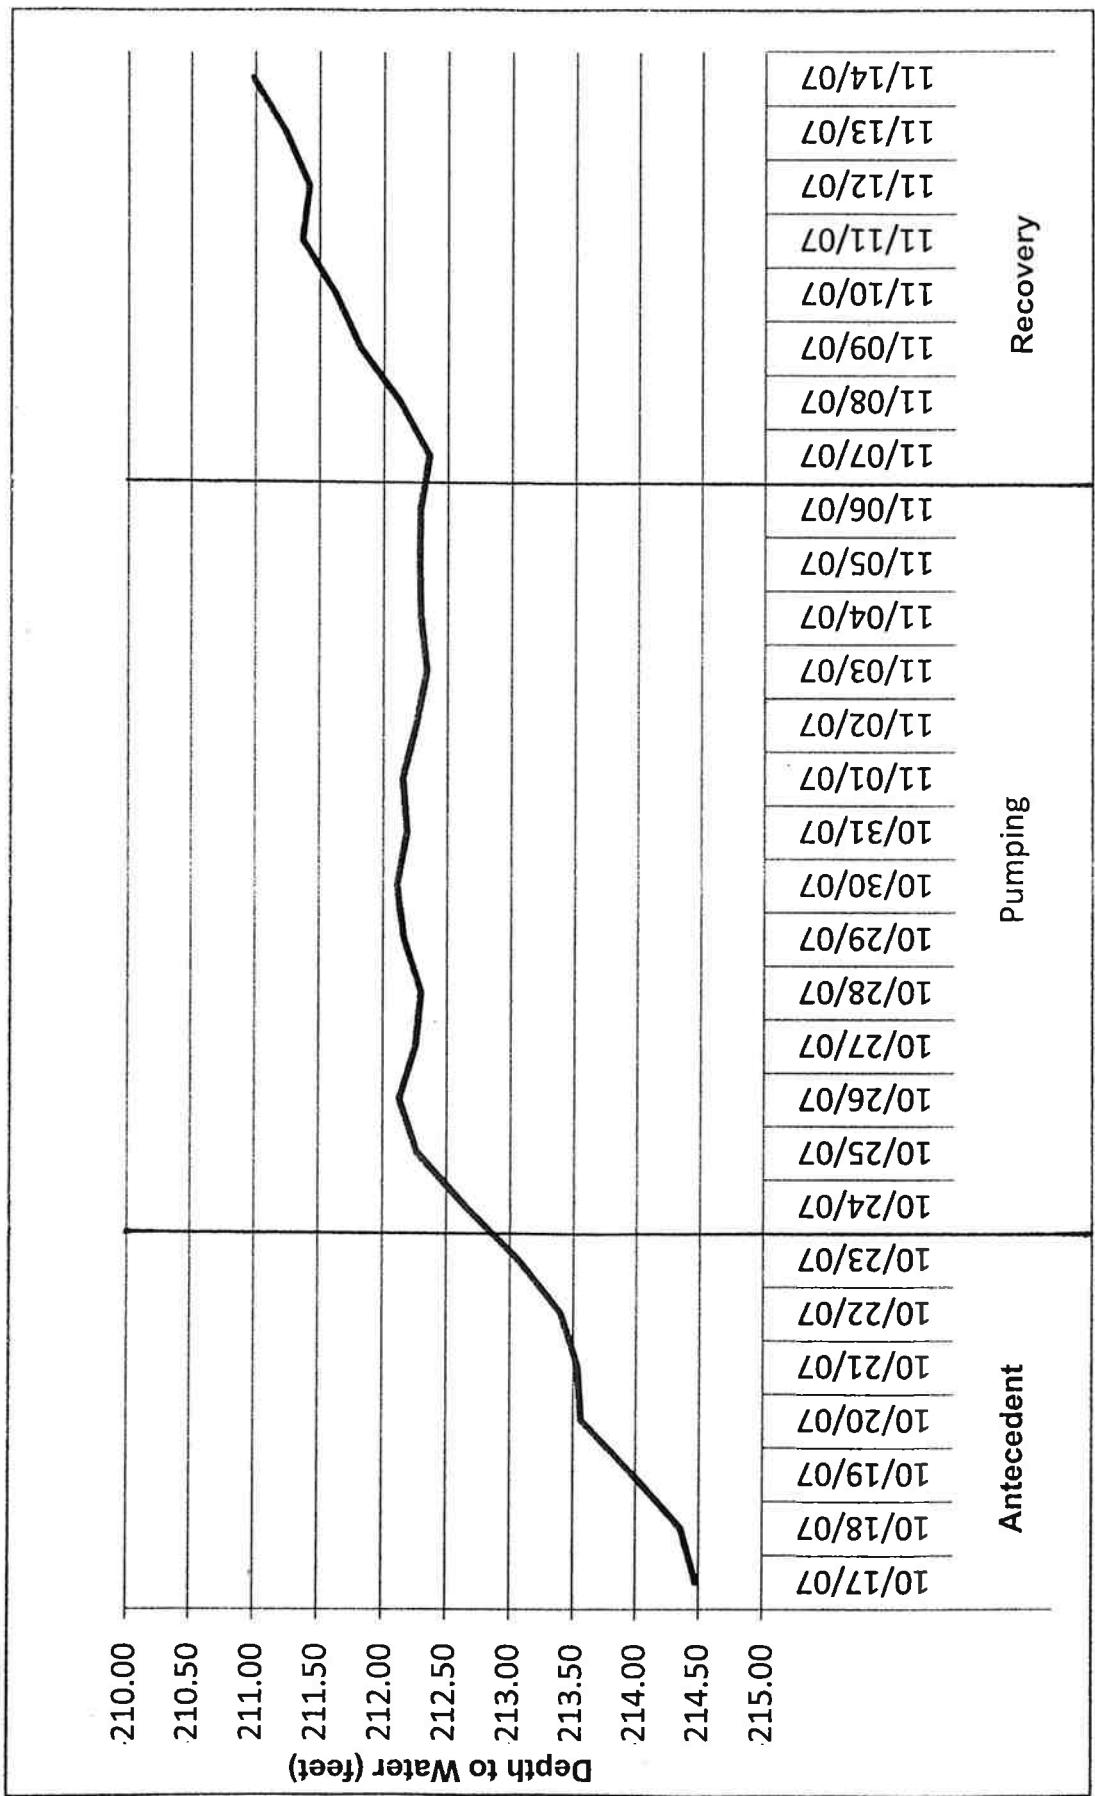

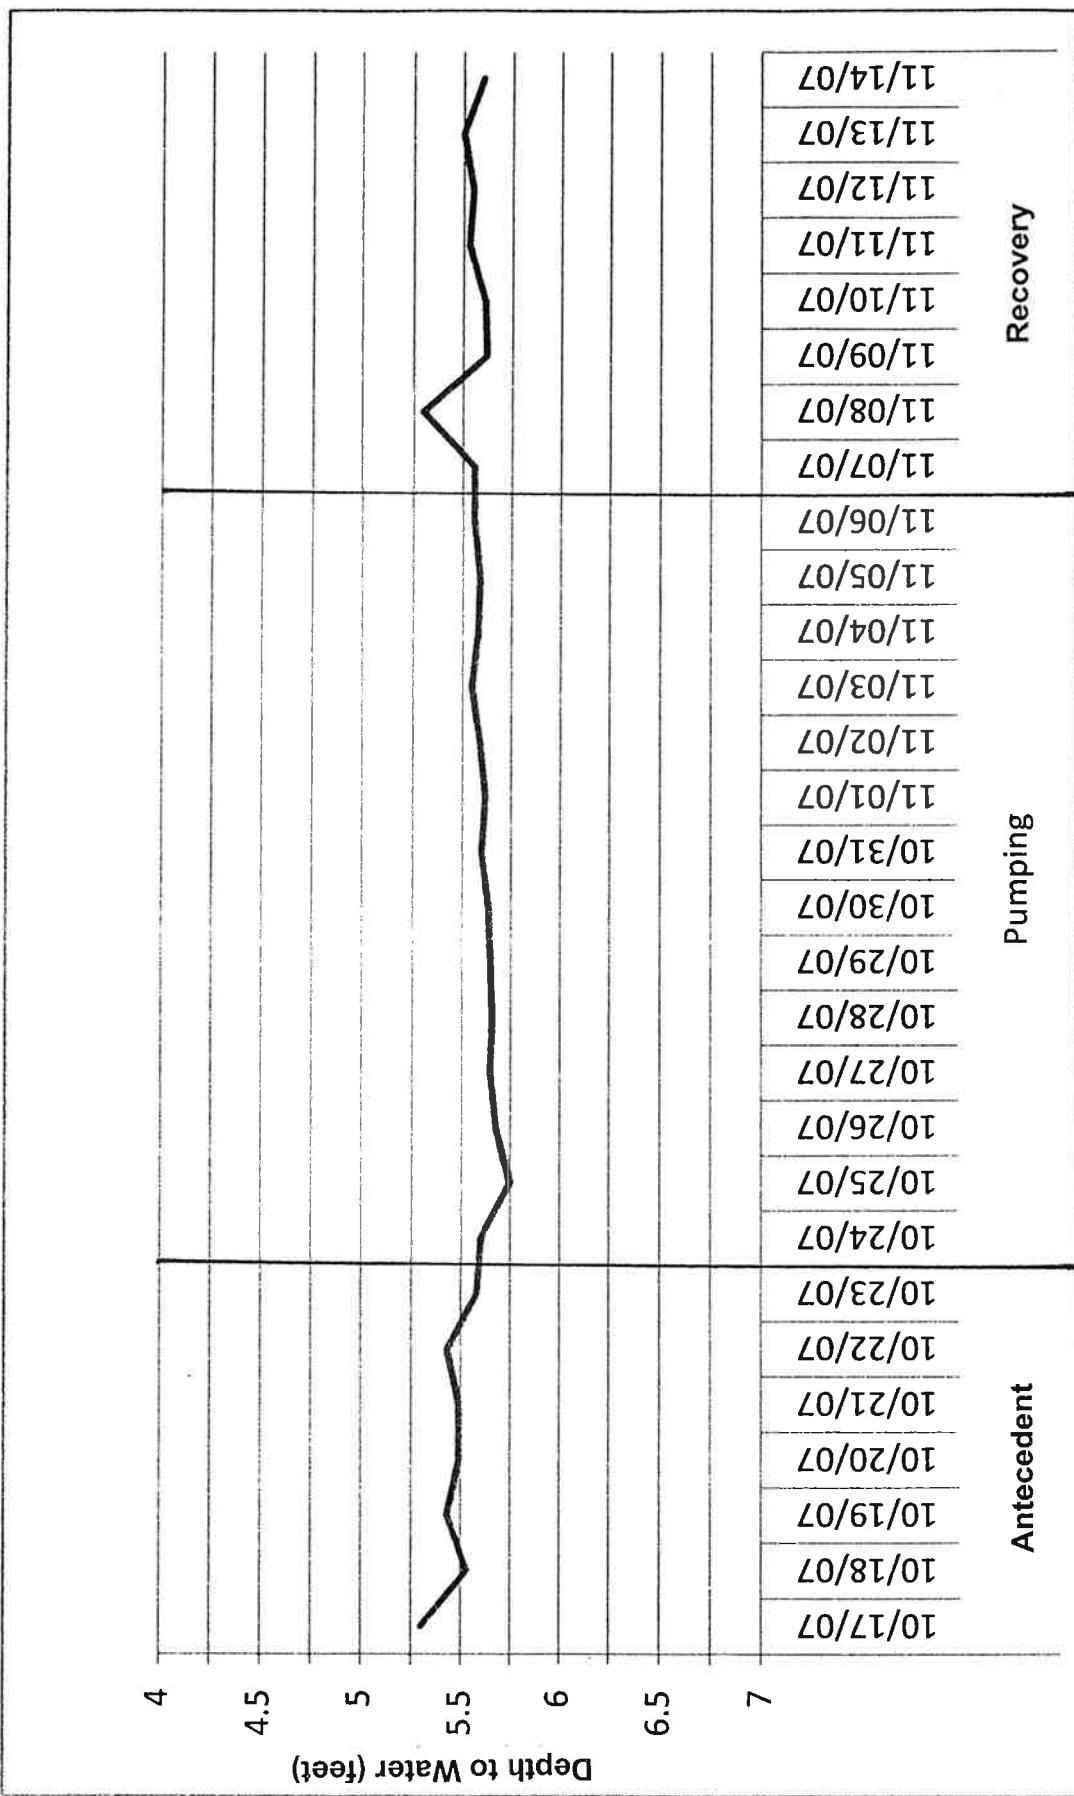

FIGURE 3-WATER-LEVEL HYDROGRAPH FOR WELL NO. 1

FIGURE 4-WATER-LEVEL HYDROGRAPH FOR WELL NO. 5A

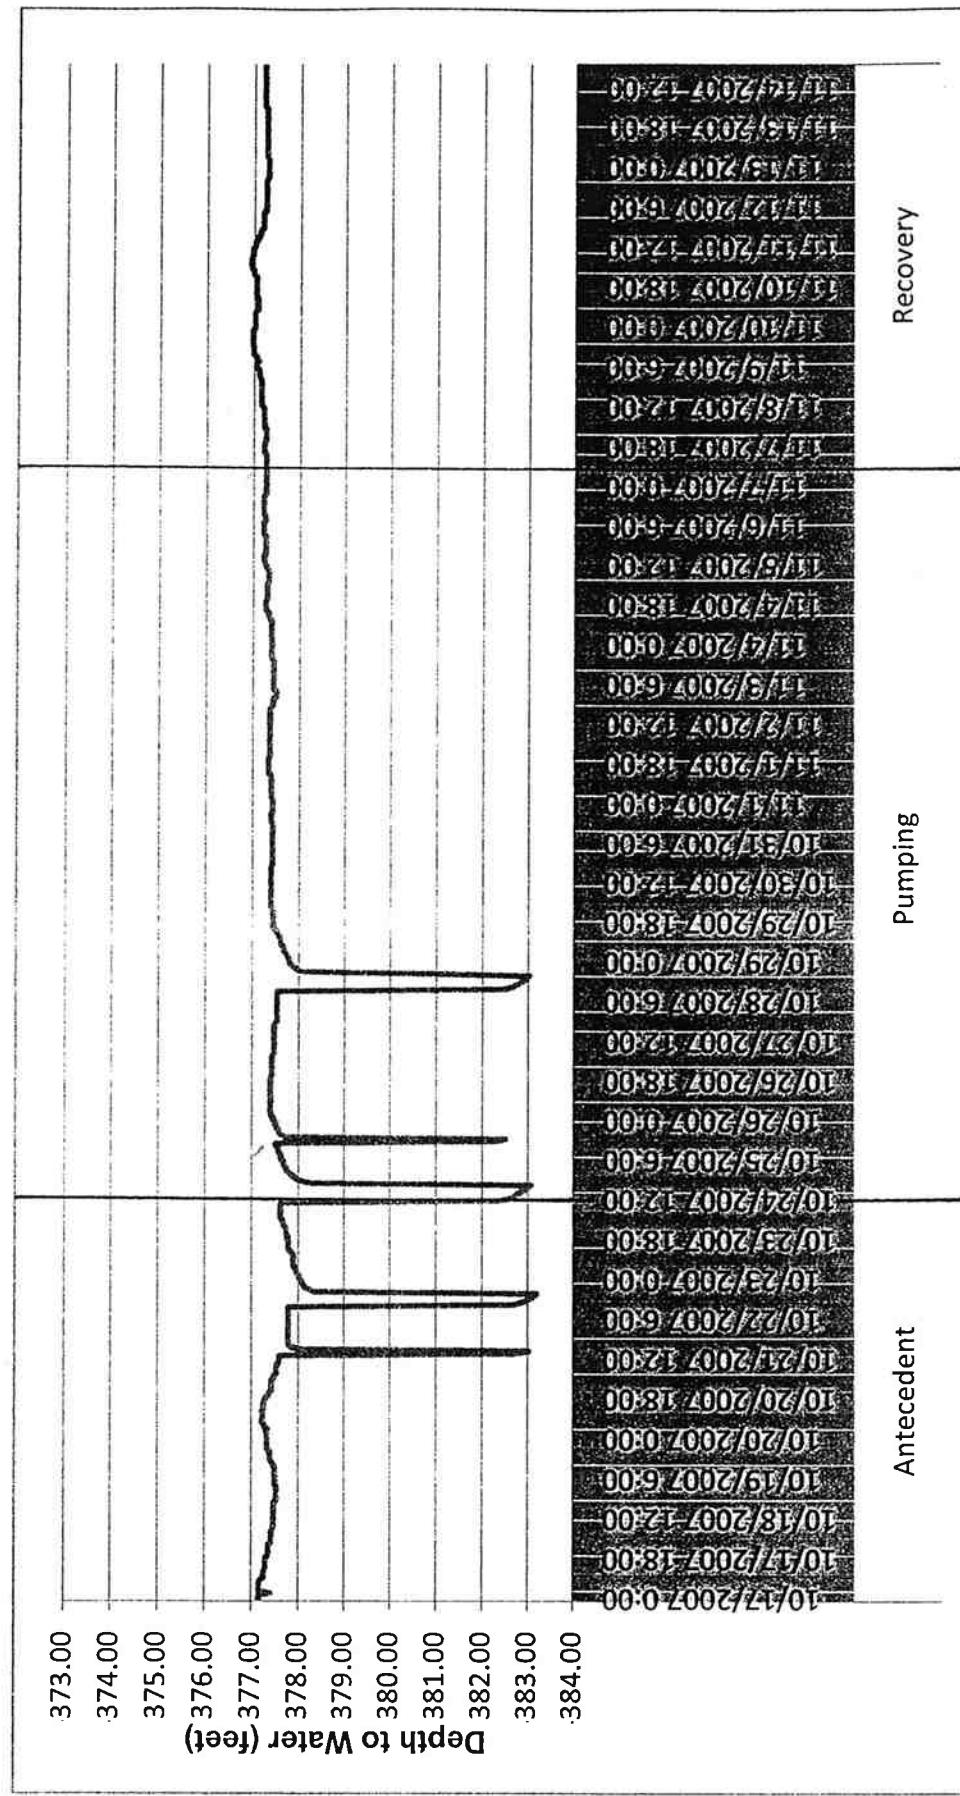

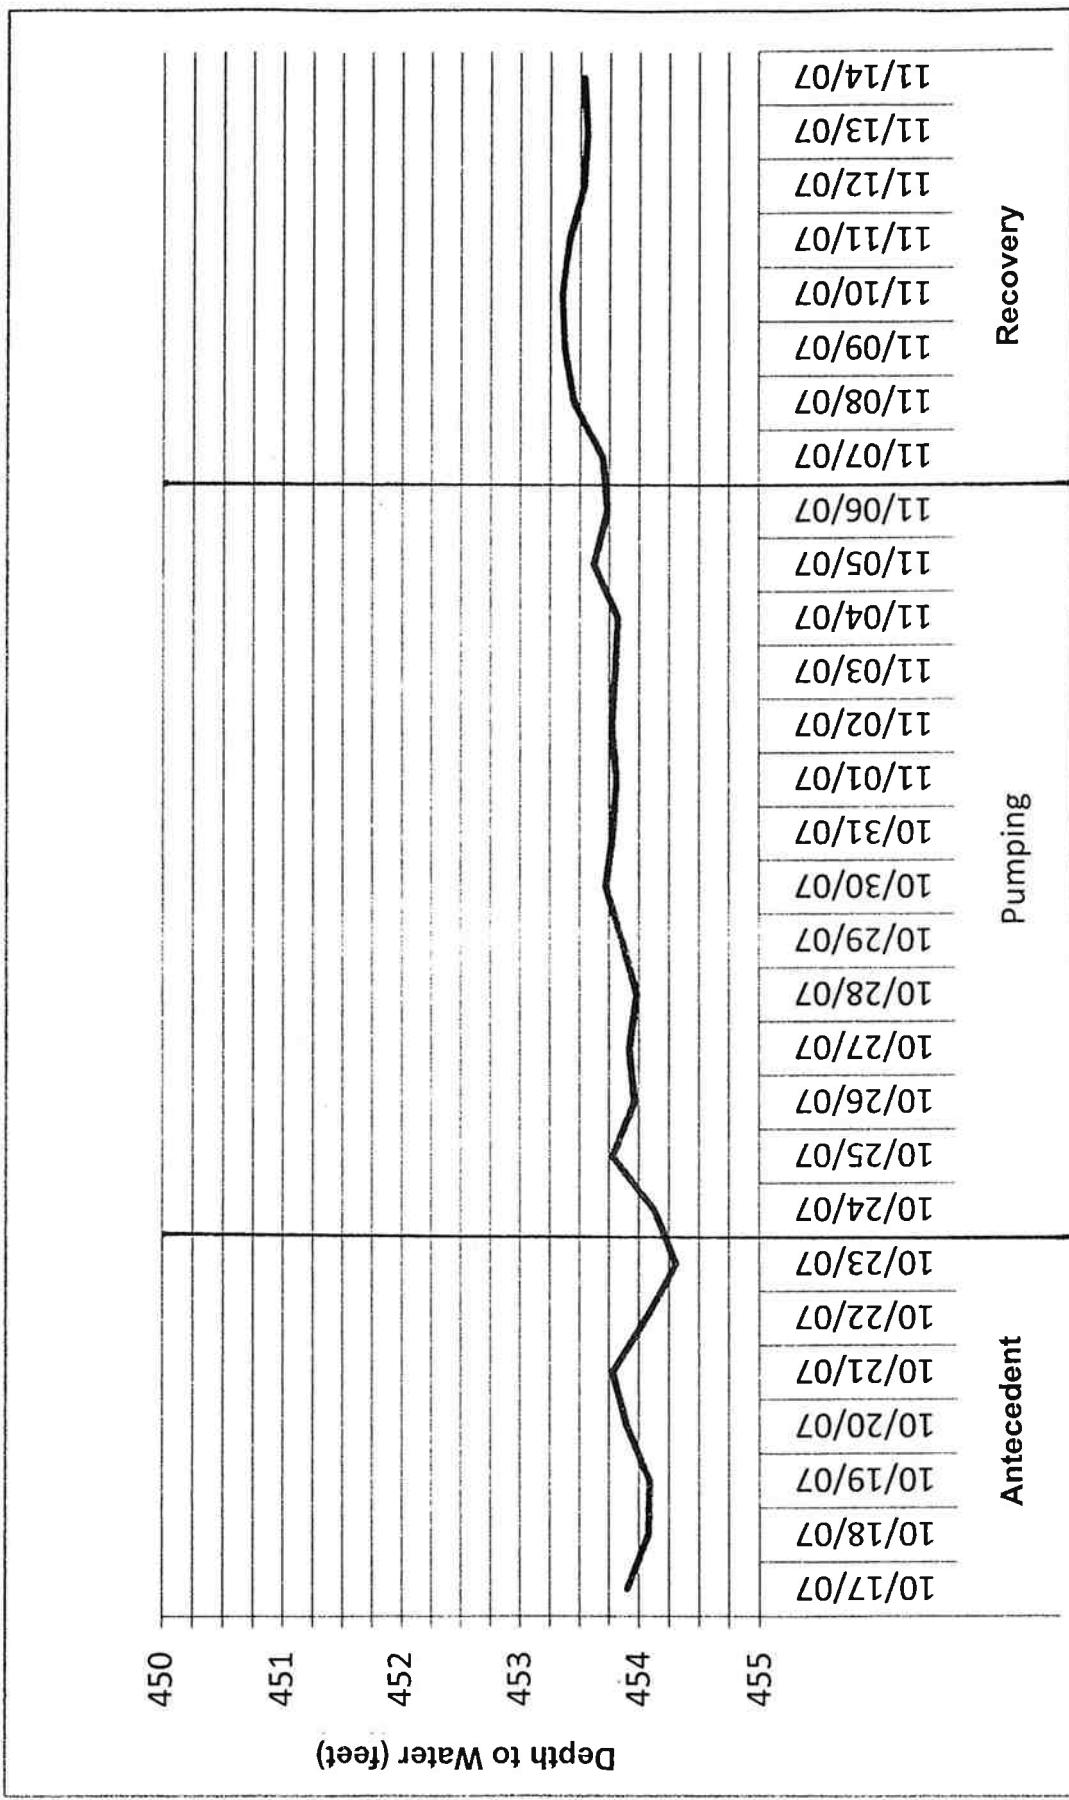

FIGURE 5-WATER-LEVEL HYDROGRAPH FOR WELL NO. 17

**FIGURE 6-WATER-LEVEL HYDROGRAPH FOR WELL NO. 30**

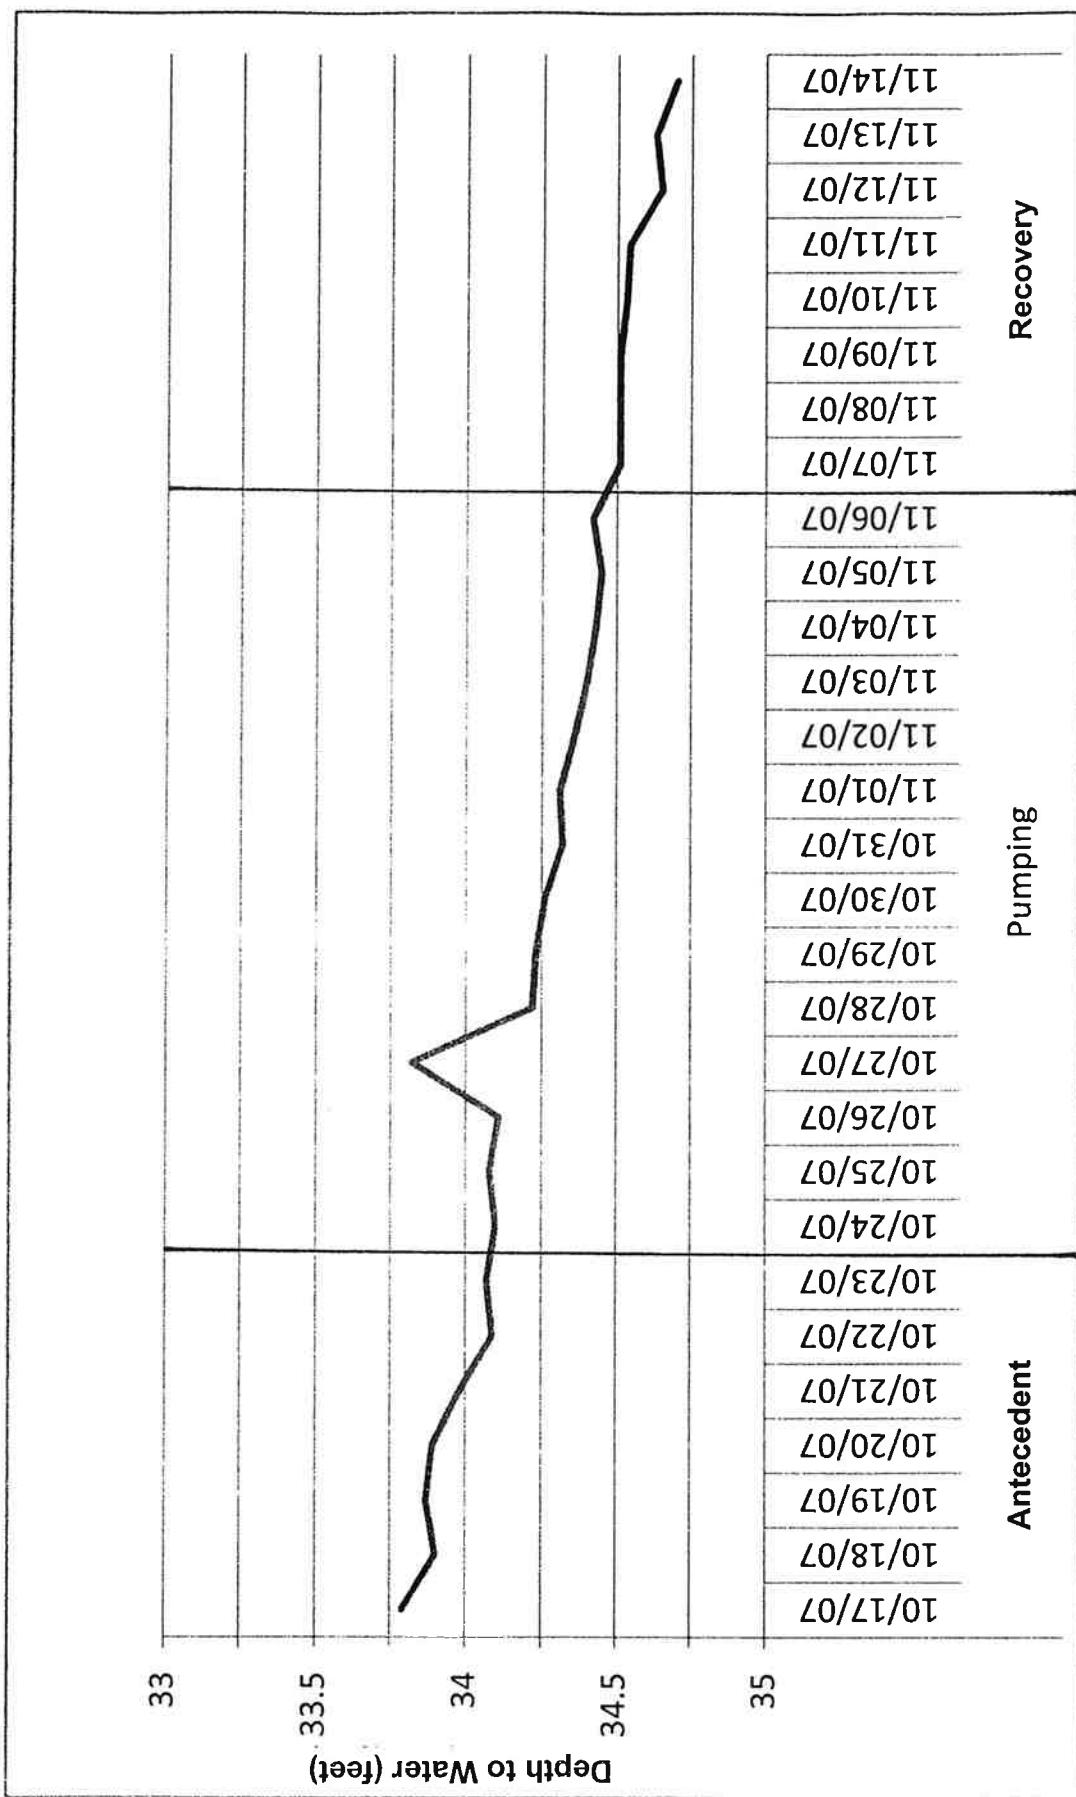

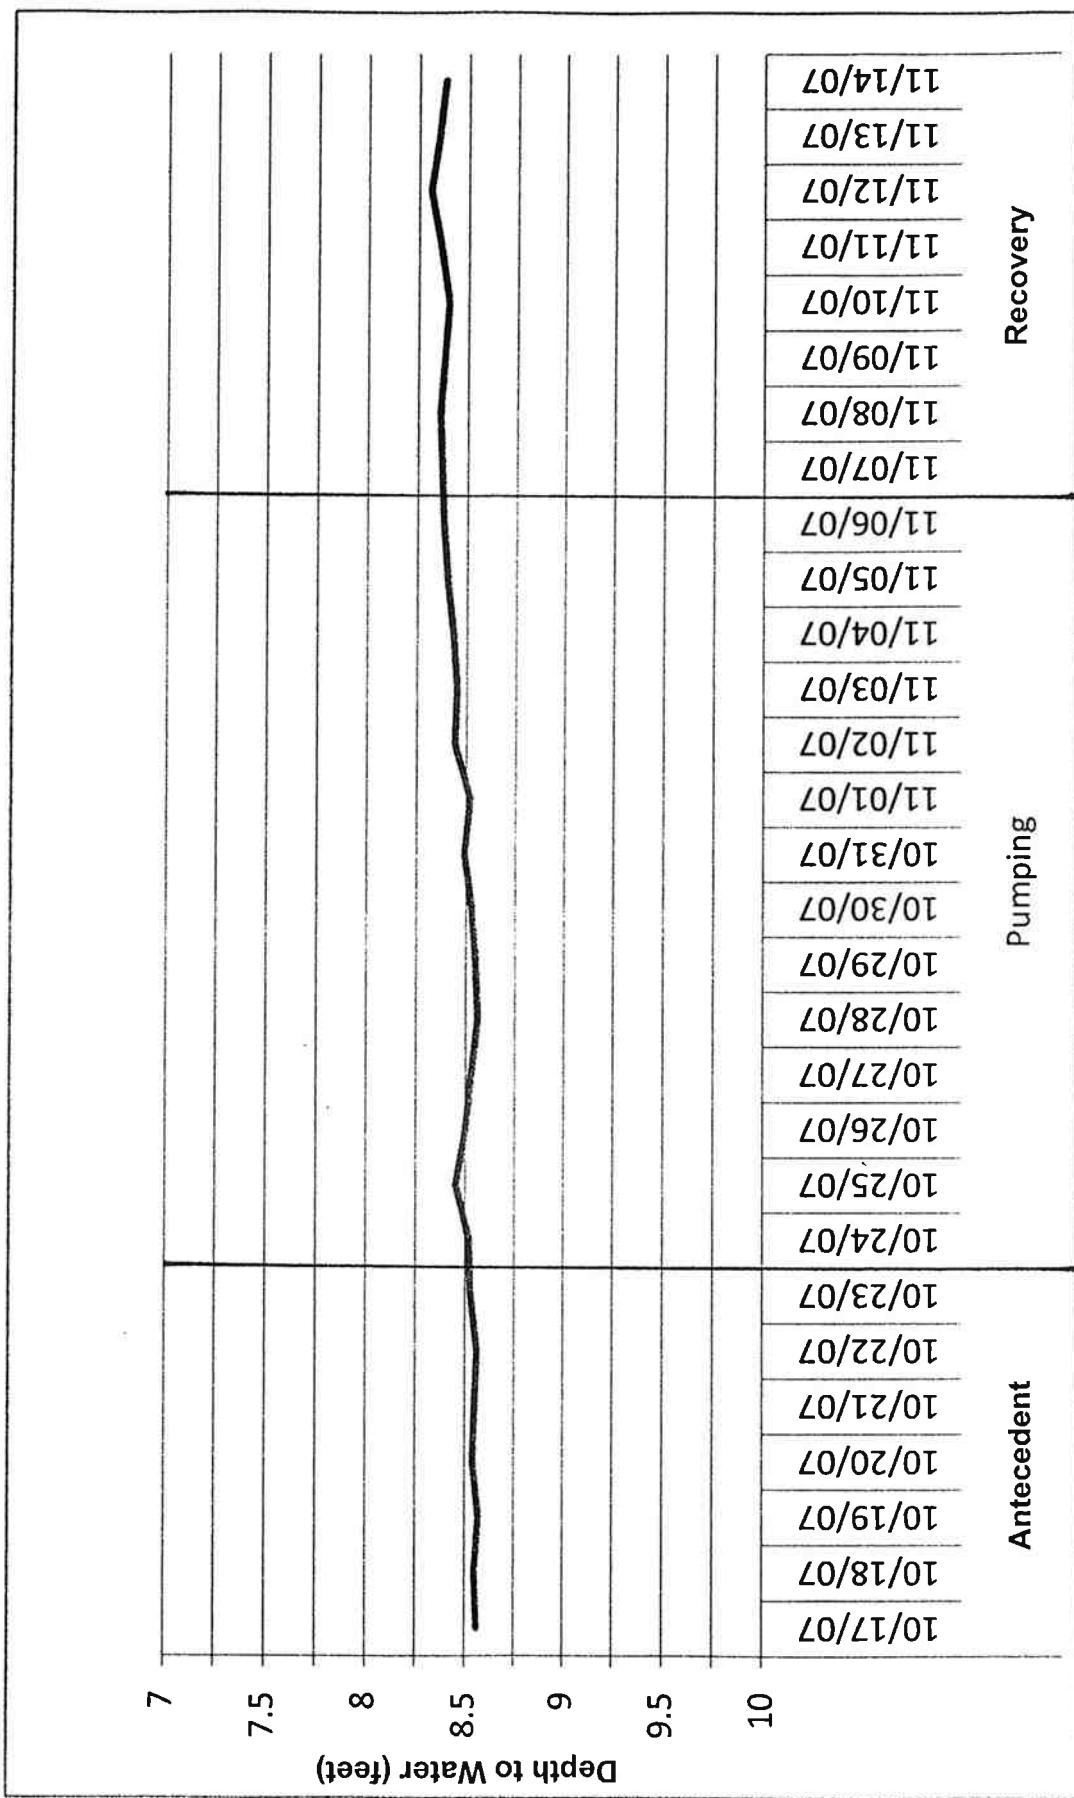

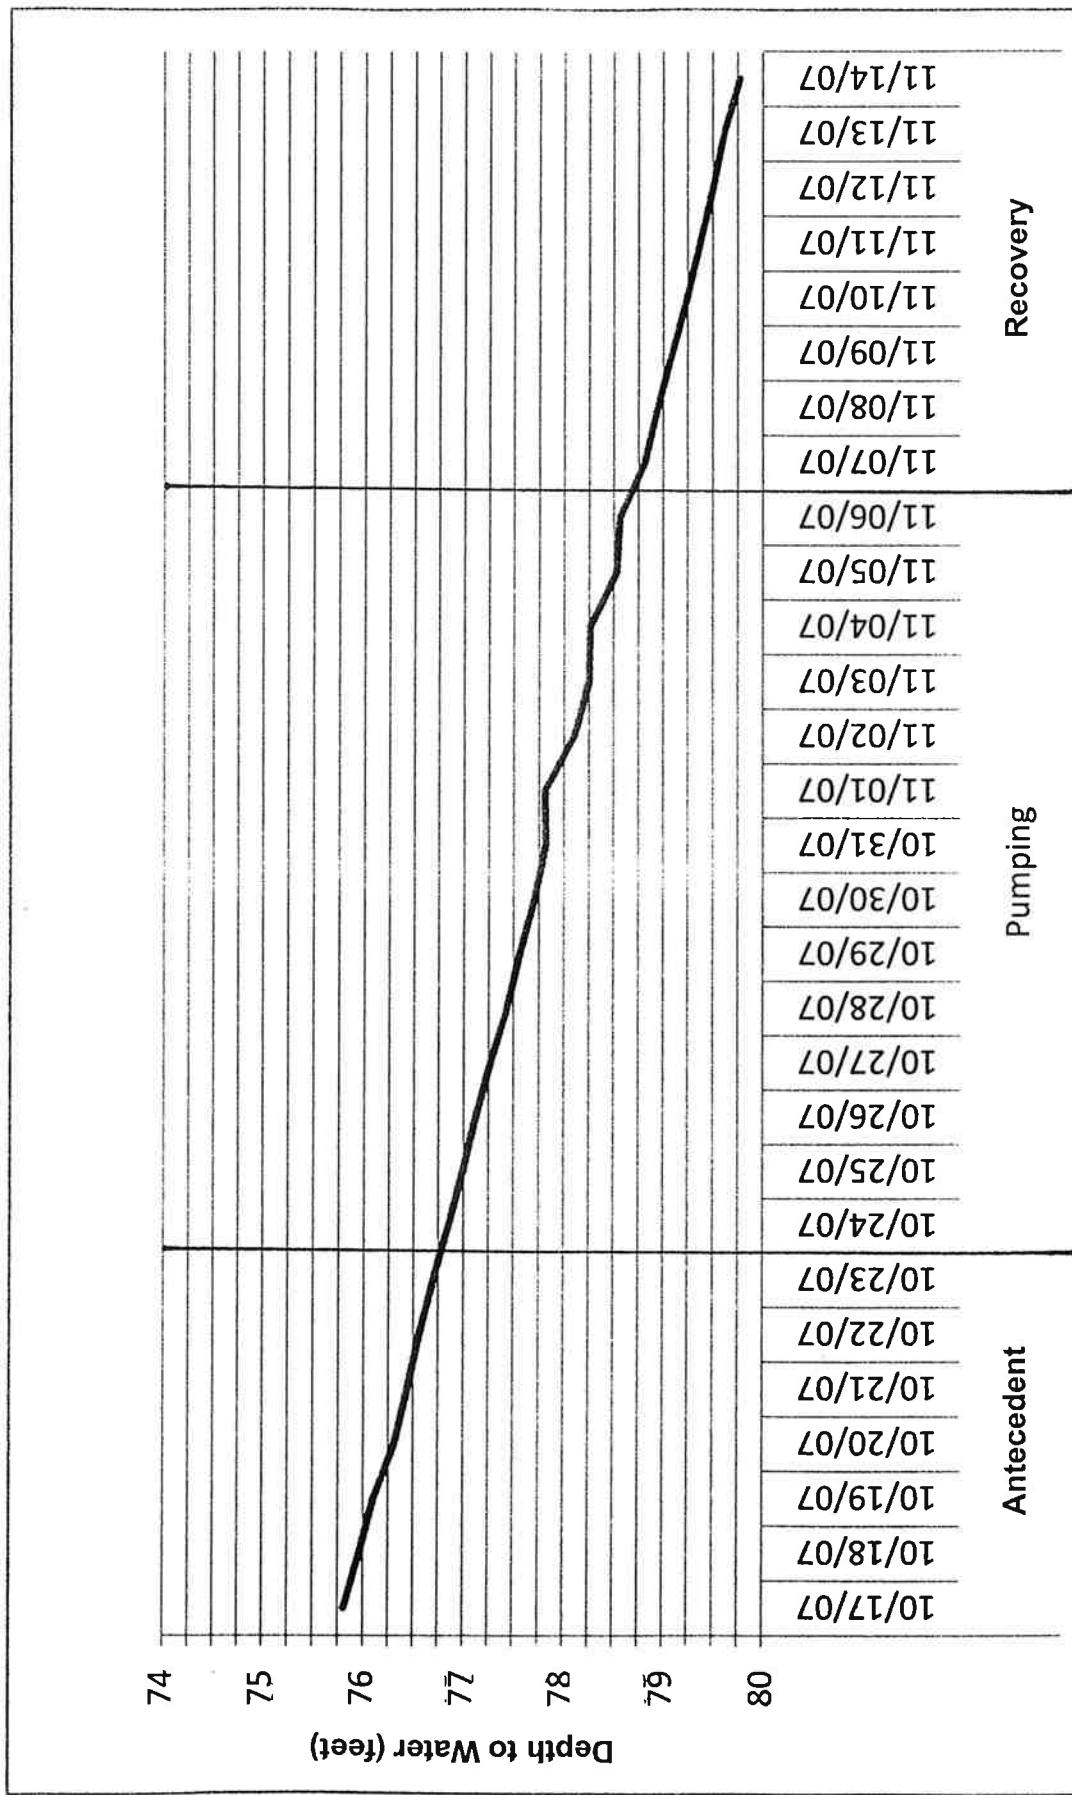

**FIGURE 7-WATER-LEVEL HYDROGRAPH FOR WELL NO. 4M**

FIGURE 8-WATER-LEVEL HYDROGRAPH FOR WELL NO. 5M

**FIGURE 9-WATER-LEVEL HYDROGRAPH FOR WELL NO. 22**

22 was essentially at this same rate. The water level in Well No. 23 rose 0.72 foot, or an average of 0.06 foot per day, during pumping of Well No. 15, compared to a near stable level for the antecedent period (Figure 10). The water level in Well No. 28 fell uniformly during all three phases of the test (Figure 11). The water level in B-3 fell 0.2 foot, or an average of 0.01 foot per day, during the entire pumping period of Well No. 15, compared to near stable levels for the antecedent period (Figure 12). However, this decline continued after pumping stopped. Thus of all the observation wells, deep Well No. 1 had the only significant drawdown due to pumping of Well No. 15.

#### RECOVERY MEASUREMENTS

Recovery measurements are provided in Appendix C.

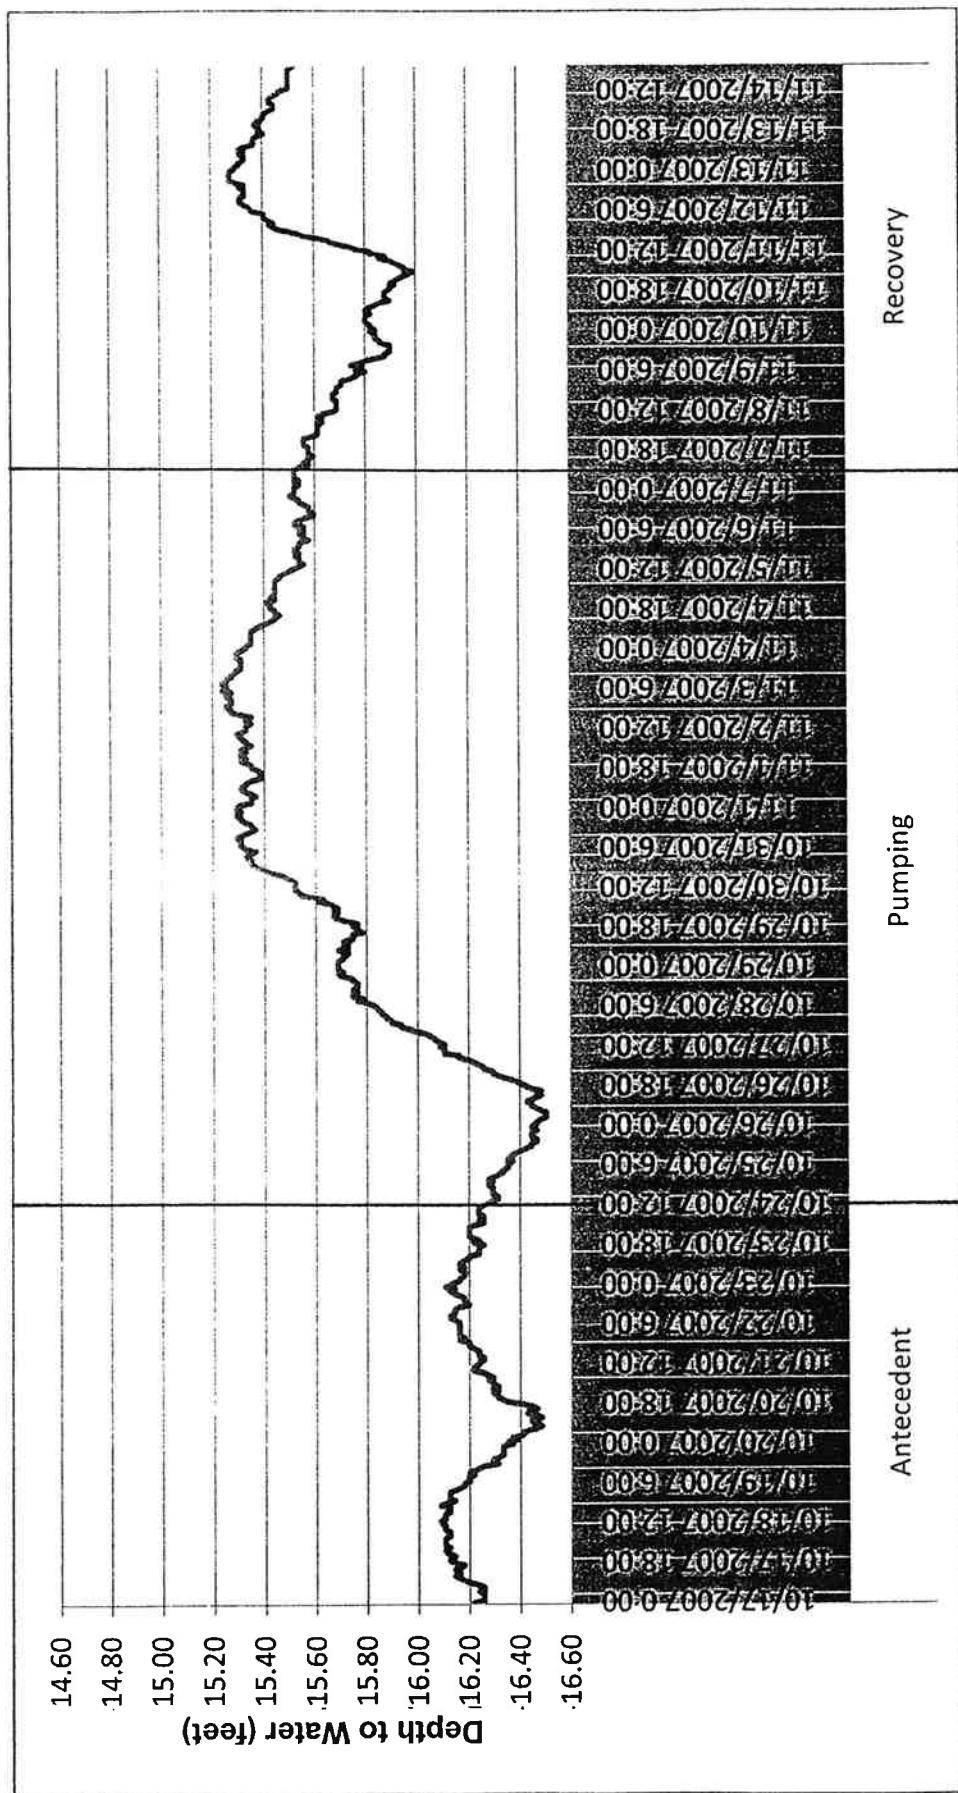

##### Pumped Well

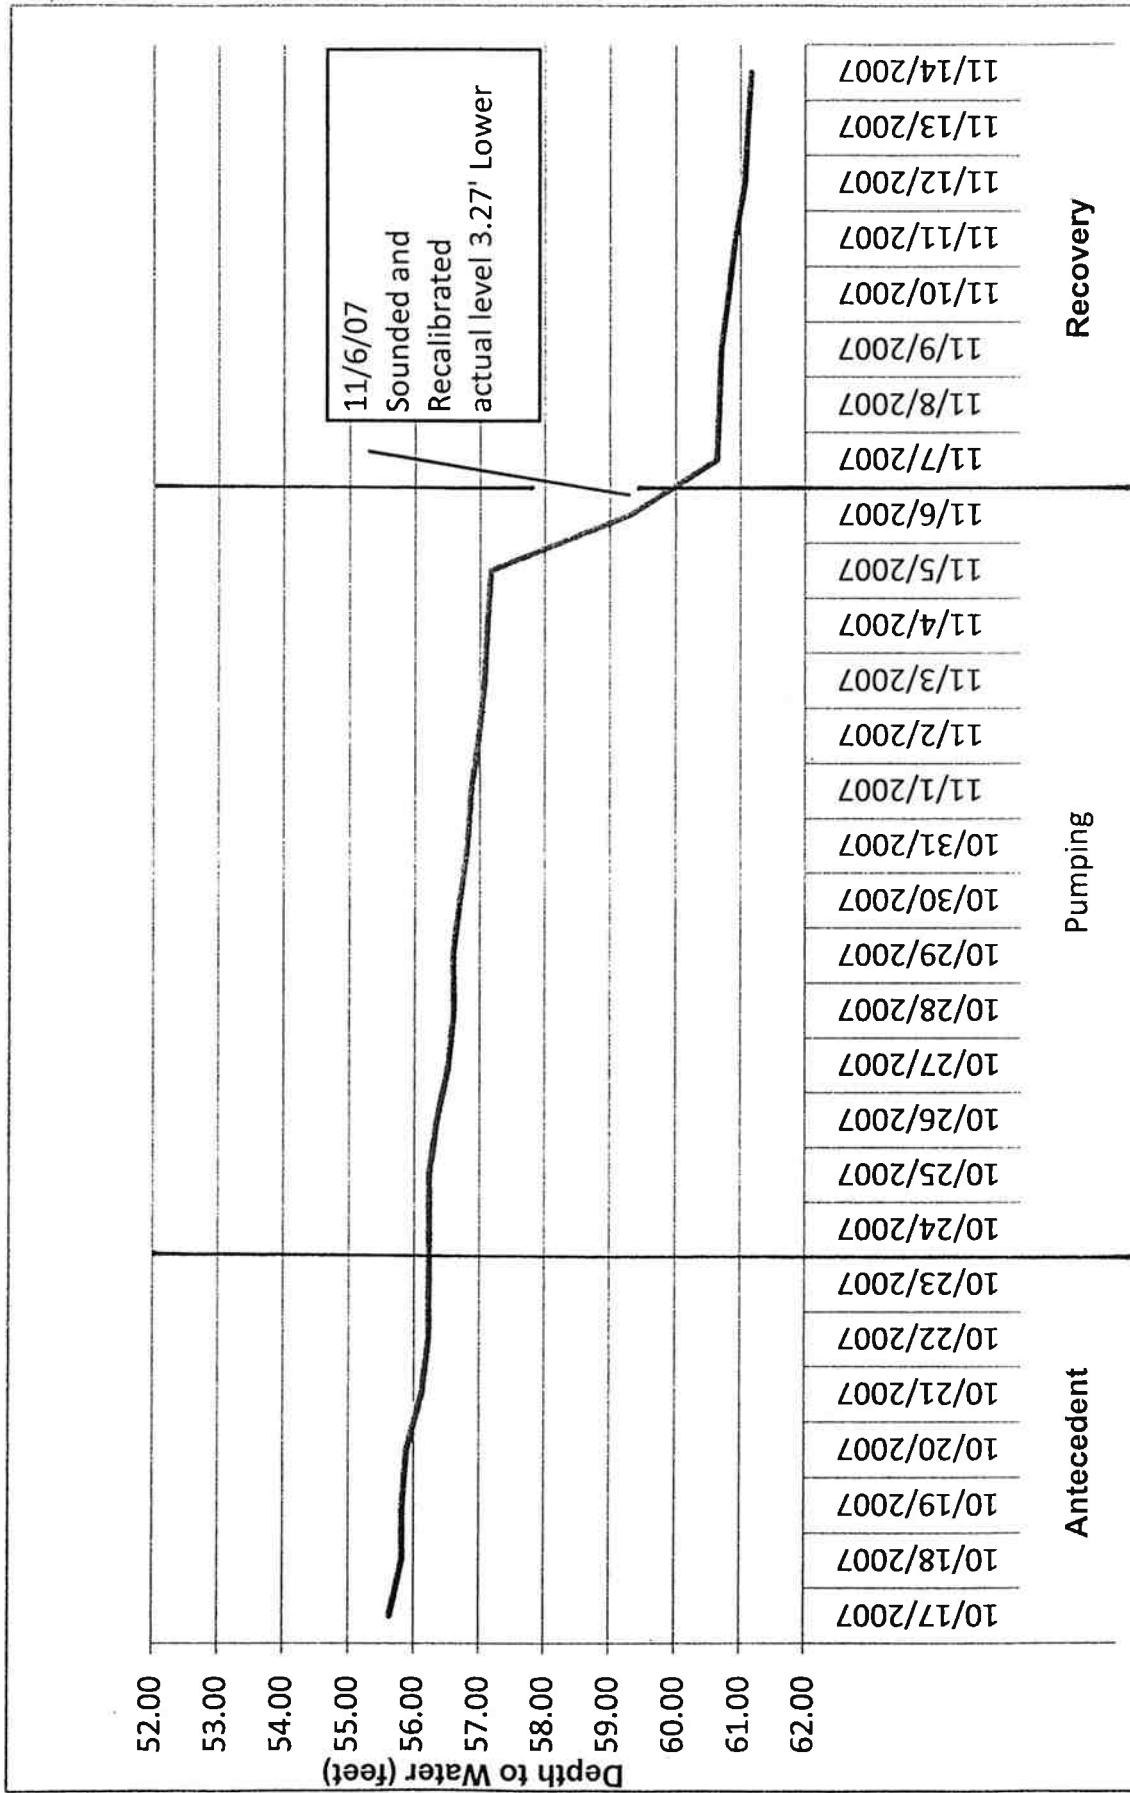

Figure 13 shows water-level recovery for Well No. 15. Within eight days after pumping stopped, the water level had fully recovered to the static level prior to pumping. Uncorrected recovery measurements indicated a transmissivity of 71,000 gpd per foot.

##### Observation Wells

###### Deep

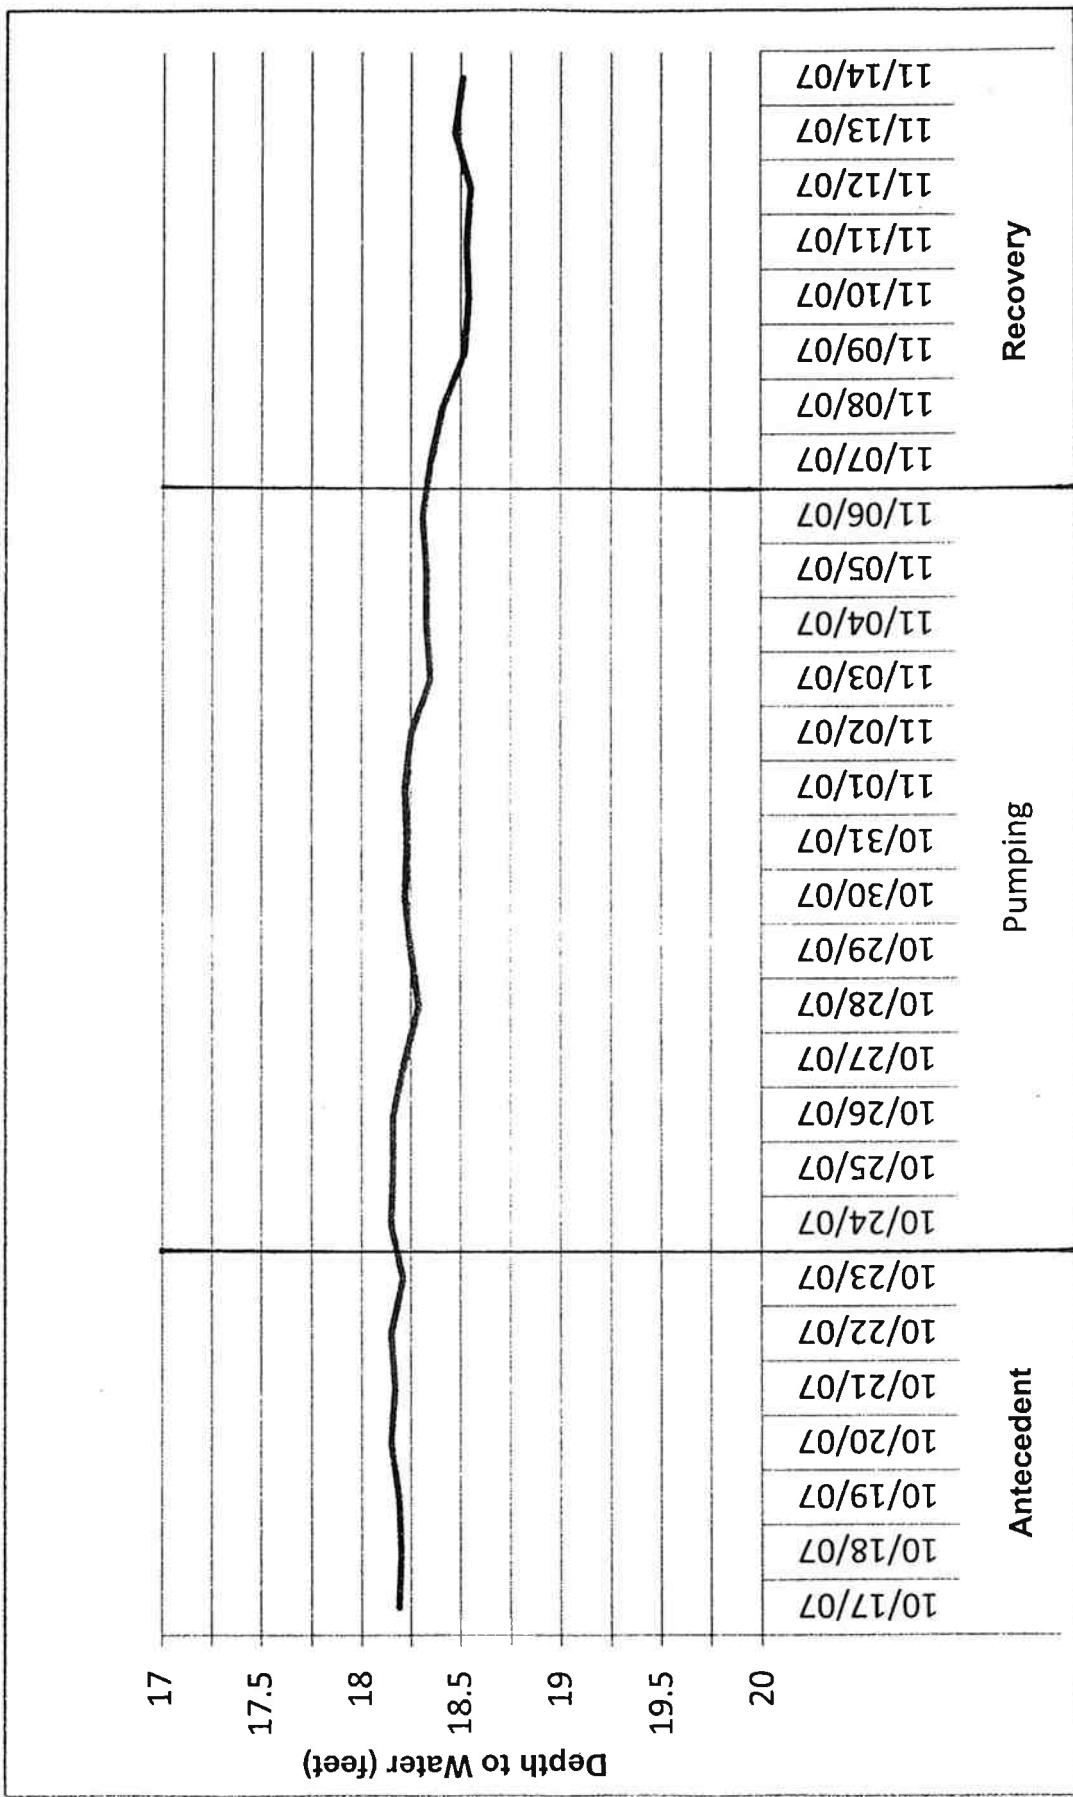

The water level in Well No. 1 (Figure 3) rose after pumping of Well No. 15 stopped. After one week of recovery, the water level had risen 1.3 feet, or an average of 0.19 foot per day. The water level in Well No. 5A (Figure 4) stayed relatively constant after

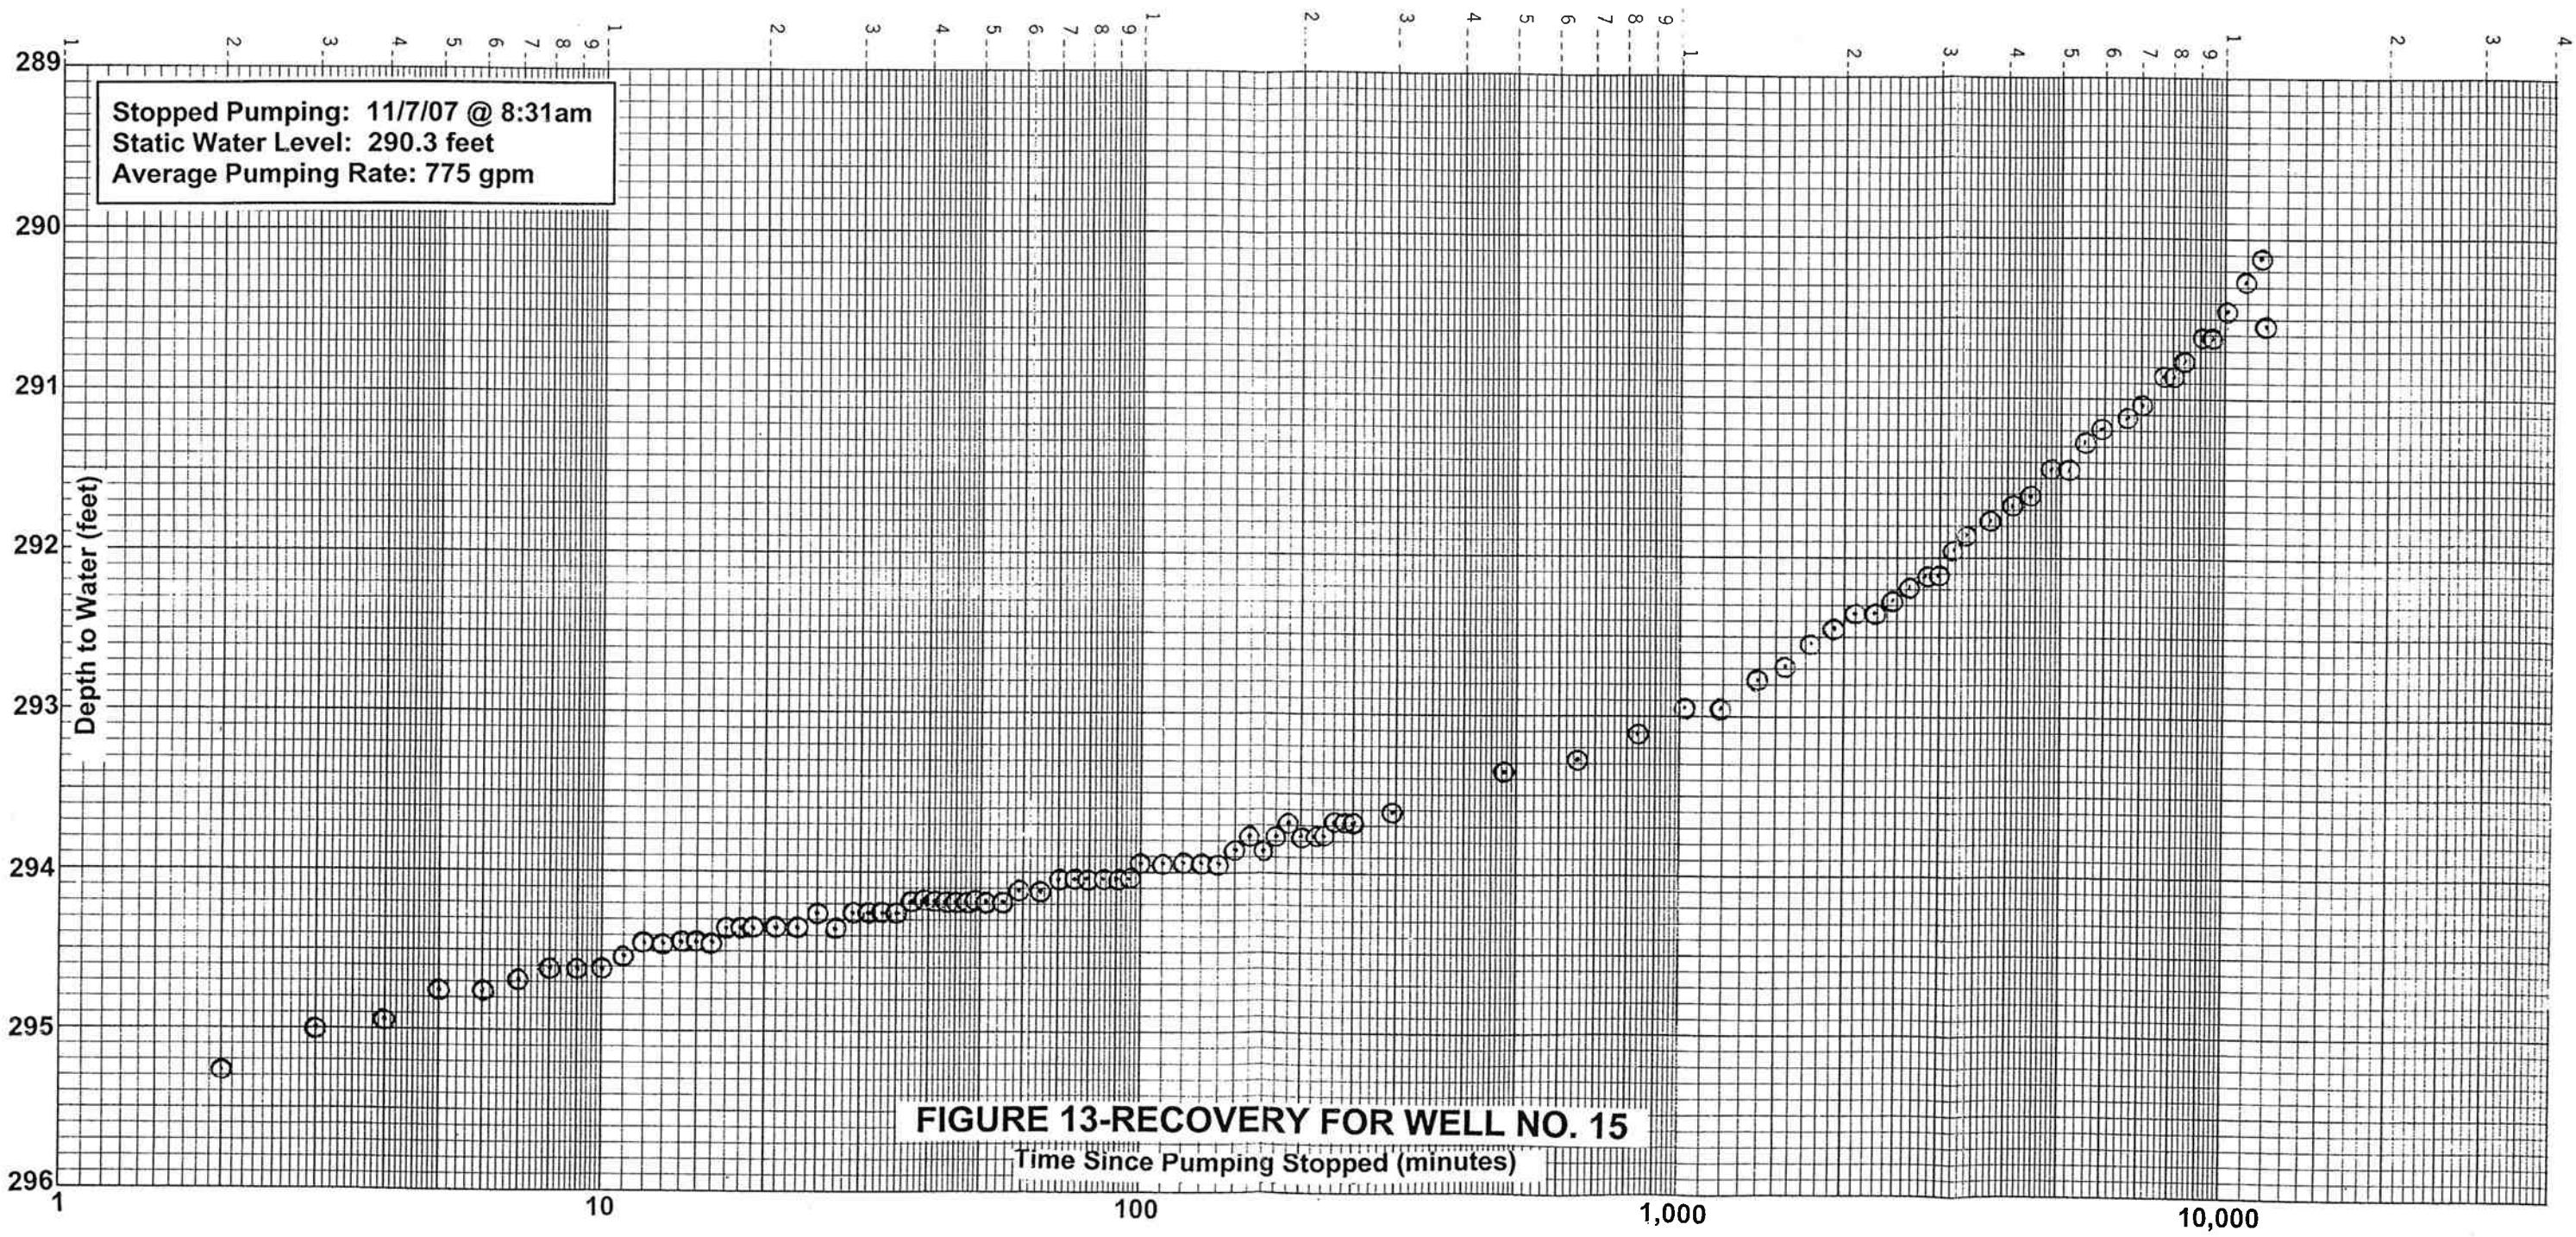

**FIGURE 10-WATER-LEVEL HYDROGRAPH FOR WELL NO. 23**

**FIGURE 11-WATER-LEVEL HYDROGRAPH FOR WELL NO. 28**

**FIGURE 12-WATER-LEVEL HYDROGRAPH FOR WELL NO. B-3**

pumping of Well No. 15 stopped. The water level in Well No. 17 (Figure 5) didn't change significantly after pumping of Well No. 15 stopped. The water level in Well No. 30 (Figure 6) rose 0.20 foot, or an average of 0.03 foot per day, after pumping of Well No. 15 stopped. This trend was the same as for the pumping period.

#### Shallow

The water level in Well No. 4M (Figure 7) fell 0.28 foot, or an average of 0.04 foot per day, after pumping of Well No. 15 stopped. This trend was essentially the same as during pumping. The water level in Well No. 5M (Figure 8) stayed relatively constant after pumping of Well No. 15 stopped. The water level in Well No. 22 (Figure 9) fell 1.26 feet, or an average of 0.18 foot per day, after pumping of Well No. 15 stopped. This trend was the same as during the pumping period. The water level in Well No. 23 (Figure 10) fell about 0.5 foot after pumping of Well No. 15 stopped, then abruptly rose about 0.7 foot. This rise was associated with increased streamflow in Mammoth Creek due to a precipitation event. The water levels in MW-23 are associated with recharge, and not the pumping of Well No. 15. The water level in Well B-3 fell 0.16 foot, or an average of 0.02 foot per day, after pumping of Well No. 15 stopped, continuing the same trend as during the pumping period. Thus water levels in none of the shallow observation wells indicated a response to pumping of Well No. 15.

#### MAMMOTH CREEK STREAMFLOW

Mammoth Creek streamflow measurements are provided in Appendix D, and are shown in Figure 14 for the antecedent period, pumping period, and recovery period for the Well No. 15 test.

##### Antecedent Conditions

Prior to pumping of Well No. 15, streamflow ranged from about 4 to 9 cfs, and was about 6 cfs just prior to the start of pumping.

##### Pumping Period

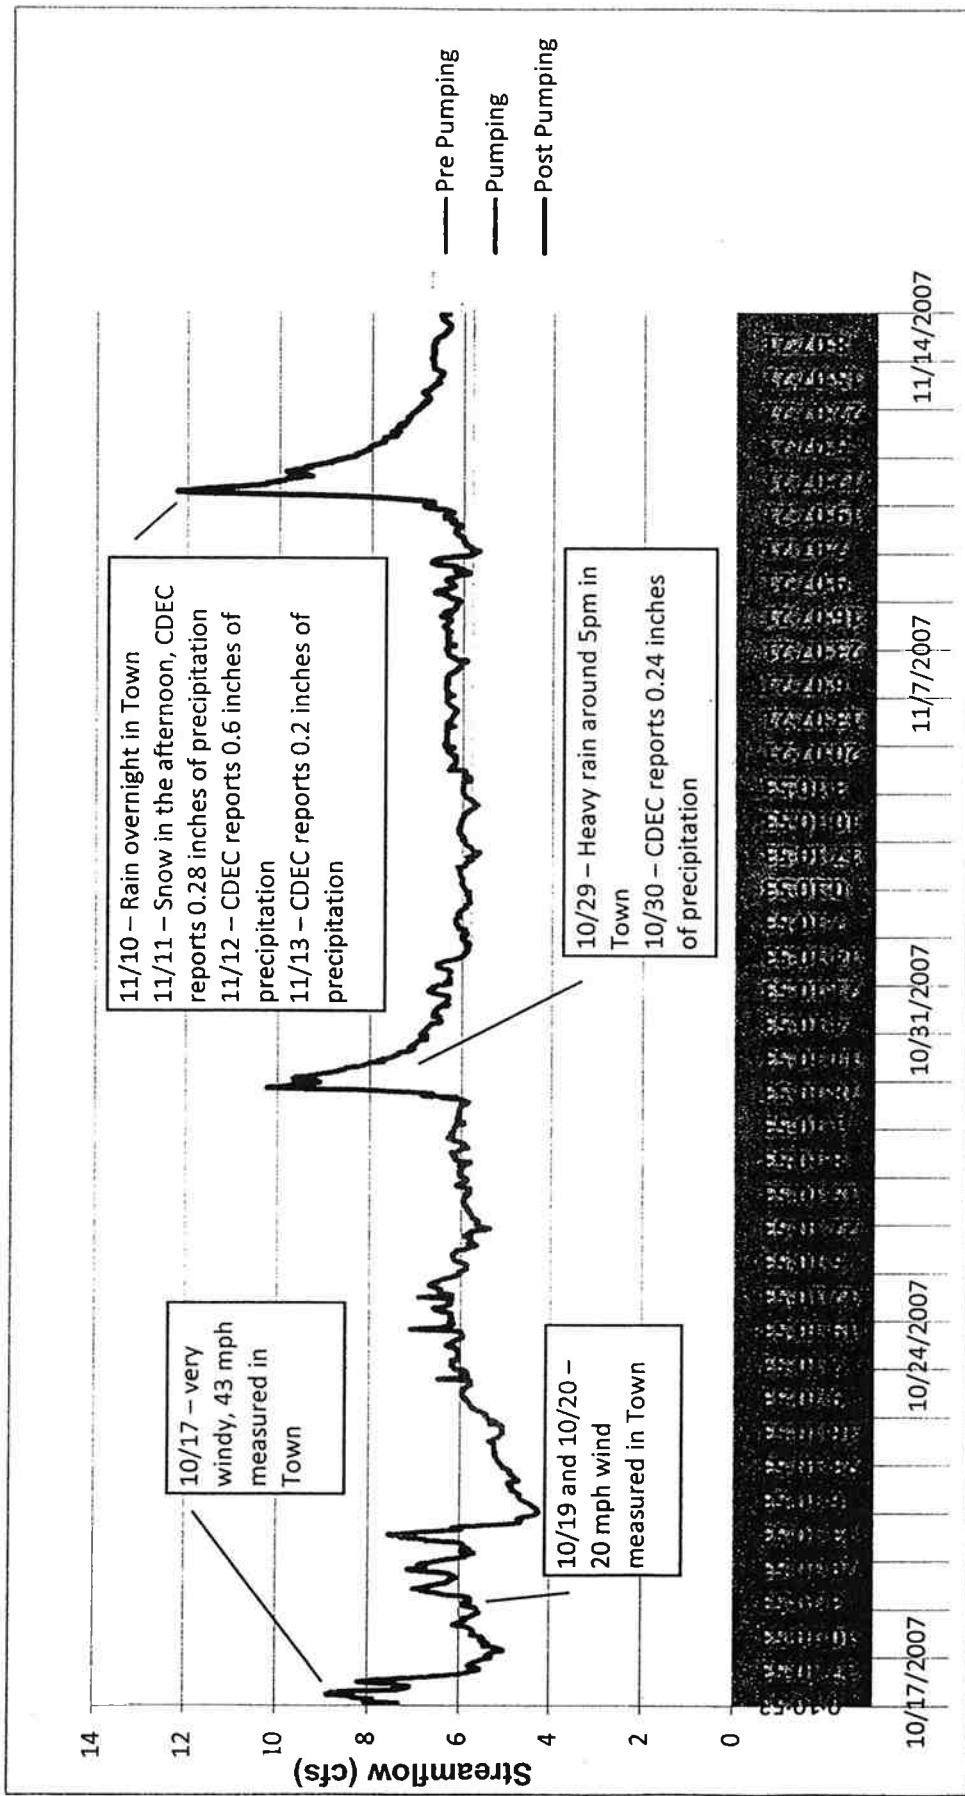

Except during and following a precipitation event on October 29-30, Mammoth Creek streamflow at Old Mammoth Road remained slightly above 6 cfs, close to the antecedent values.

##### Recovery Period

After pumping of Well No. 15 stopped, the streamflow remained slightly above 6 cfs, except during and following a precipitation event during November 10-13. Thus there was no noticeable influence of pumping of Well No. 15 on Mammoth Creek streamflow at Old Mammoth Road during the pump test.

#### WATER QUALITY

Water samples were collected from Well No. 15 on a daily basis (except for weekends) for determination of temperature, pH, and electrical conductivity (Appendix E). The temperature of the pumped water gradually rose during pumping, from 50°F early in the

**FIGURE 14-MAMMOTH CREEK STREAMFLOW**

pumping period to 54°F near the end of the pumping period. This trend likely is due to production of more deeper groundwater as pumping progressed. The temperature of Mammoth Creek streamflow at Old Mammoth Road ranged from about 37°F to 47°F during the pumping period.

The pH of water from Well No. 15 was fairly constant (about 7.3 to 7.4) after the first several days of pumping. The electrical conductivity of water from Well No. 15 increased from 272 micromhos per centimeter at 25°C early in the pumping period to 354 micromhos near the end of the pumping period. The electrical conductivity of Mammoth Creek streamflow ranged from about 229 to 237 micromhos during the pumping period, and stayed relatively constant. Thus there was no indication of an influence of streamflow seepage on the chemical quality of water from Well No. 15 during the test.
